

Moldex3D eXplorer 2011 for SolidWorks Release Note

Published: 2011-04-06_v01

CoreTech System has released **Moldex3D eXplorer 2011** with following critical enhancements. This release will increase utilization and user friendliness and create higher value in the product development process.

New Features in eXplorer 2011

Surface display of temperature results

Users are able to visualize 3D temperature analysis results from surface distributions, including melt front temperature, maximum temperature, average temperature and frozen layer ratio. Armed with these informative surface results, users can better assess the molding process and part quality.

Variable gate size

Users are able to setup appropriate gate size and verify its effect on the filling patterns of part designs.

Traceable analysis history

This new function automatically records every analysis result of a part. As a result, users can compare the filling results of different process conditions and acquire a better simulation solution.

Save your projects in selected folders

Simulation projects now can be saved to the folders specified by users for the later use.

Enhancements and Bug Fixing

Support multi-language user interface, including English, Traditional Chinese, Simplified Chinese, and Japanese.

Improve mesh generation stability

Improve solver calculation stability

Improve UI design to prevent users' wrong movement

Fix bugs about building gates
